MVLU COLLEGE

Aim: Create a simple Adhoc network using OMNeT++ and INET framework.

Procedure Summary:

- **Installed OMNeT++ and imported the INET framework package.**
- **Created a new network module Net1.ned under inet/examples/adhoc/SimpleAdhoc/ using the *Managed Mobility Wireless Network Wizard* with 5 wireless hosts and ping traffic enabled.**
- **Configured network dimensions, physical channel parameters, MassMobility motion models, and ping destination parameters in omnetpp.ini.**
- **Executed the simulation to analyze dynamic node mobility and ad-hoc communication ranges.**

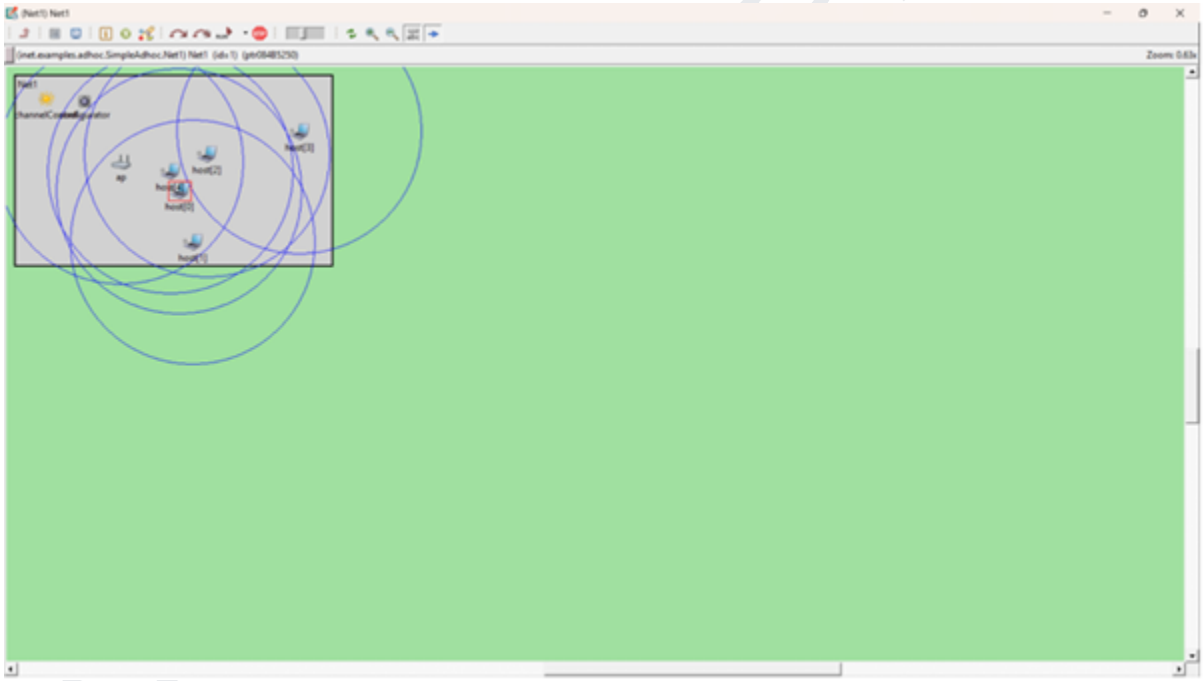

Figure 1: OMNeT++ simulation output showing mobile wireless hosts communicating dynamically over an Adhoc network with transmission/interference ranges and access point configurators.

Conclusion: Successfully created and simulated a simple ad-hoc wireless network with dynamic host mobility and ping packet transmission using OMNeT++ and INET framework
